EDUCATION

VES Institute of Technology <i>Bachelor of Engineering in Electronics and Computer Science – CGPA: 9.78 (Sem VI)</i>	Chembur, Mumbai Aug. 2023 – Present
Royal Junior College of Science and Commerce <i>Class XII: 87%</i>	Dombivli, Thane May 2023
Vidya Niketan <i>Class X: 80.60%</i>	Dombivli, Thane May 2021

PROJECTS

Atlas GitHub <i>Python, FastAPI, Browser-Use SDK</i>	May 2026 – Present
- Developing a multi-agent orchestration that decomposes user goals into executable workflows using specialized agents for browser automation, web research, and document understanding. - Designing a modular agent architecture that enables dynamic task delegation, extensible tools, and provider-independent local or cloud LLM integration. - Implementing a human-in-the-loop execution flow that pauses high-impact actions for user approval before continuing automated workflows. - Packaging Atlas as an installable CLI application with an optional web UI to provide a seamless local setup experience.	
Autotally GitHub <i>Next.js, FastAPI</i>	Dec 2025 – Feb 2026
- Built an AI-assisted invoice processing platform that converts scanned invoices into TallyPrime-compatible vouchers, reducing manual accounting data entry. - Designed a multimodal document extraction pipeline that converts invoices into structured accounting data while preserving document context for improved accuracy. - Developed a validation pipeline combining deterministic business-rule checks with AI outputs to improve reliability before generating accounting vouchers. - Engineered a configurable AI provider layer allowing users to choose between popular cloud LLMs (Gemini, OpenAI, Claude) or local models.	
F1 Game Telemetry Streaming Platform GitHub <i>React, FastAPI</i>	Dec 2025 – Jan 2026
- Engineered a real-time telemetry pipeline for EA Sports F1 2020, ingesting the game's 60 Hz (configurable in game) stream and decoding raw telemetry into structured events using the f1-2020-telemetry package. - Integrated a Redis message broker using a publish-subscribe model to decouple telemetry ingestion from client delivery. - Built an asynchronous FastAPI consumer to stream telemetry updates to concurrent web clients via WebSockets while maintaining responsive user interactions. - Implemented telemetry throttling and aggregation strategies to reduce unnecessary network traffic while preserving the responsiveness of live race visualizations.	

TECHNICAL SKILLS

Languages: C++, Python, TypeScript, SQL
Frameworks & Libraries: FastAPI, Next.js, React
Concepts & Technologies: REST APIs, JSON, XML, WebSockets
Fundamentals: Data Structures & Algorithms, Object-Oriented Programming, Operating Systems, Database Management Systems
Developer Tools: Git & GitHub, Postman, Visual Studio Code, GitHub Copilot, Google Antigravity 2.0

CODING PROFILES

- Solved **400+** **Data Structures & Algorithms** problems across **LeetCode**, **GeeksforGeeks**, and **HackerRank**, achieving a maximum **LeetCode** rating of **1543**.
- HackerRank Problem Solving (**Intermediate**, **Basic**)
